

# High-voltage programmable micro-power Hall switch IC

## 1. Features

- AEC-Q100 Grade 0
- ISO26262 ASIL B
- Wide voltage range: 3V to 40V
- Programmable parameters:
  - Unipolar or Omnipolar
  - Micro power mode
  - Sensitivity range: -22mT to 22mT
  - Active Pole: North or South
  - Output: Direct or Inverted
- Less than 20 $\mu$ A average current in micro-Power Mode
- Open-Drain output
- CRC check protection
- Reverse battery protection: -28V
- Thermal shutdown protection
- Wide operating temperature range:
  - -40°C to 150°C
- High EMC/ESD immunity
- Small package:
  - 3-pin TO-92S (UA)
  - 3-pin SOT23-3L (SO)

## 2. Applications

- Shift Lever Position Check
- E-Door Handle
- Detection of Car Door Lock Status
- Seat Position Detection
- Sunroof/Tailgate Opener
- Electronic Steering Column Lock
- Brake Light Switch

## 3. Description

SC245X produced with BCD technology, it is a programmable micro-power mode automotive-grade Hall effect sensor. It is developed in accordance with the ISO 26262 standard and supports the ASIL B functional safety level. Programmable is a key attribute of the SC245X. Customer can select pre-programmed units, or program at end of line to realize the system optimization across a range spanning -22mT to 22mT.

SC245X is specifically designed according to the requirements of automotive applications, complies with the AEC-Q100 standard, supports operation with voltages ranging from 3V to 40V, and features -28V reverse voltage protection and over-temperature protection functions.

SC245X device is available in either a TO-92S package (UA), or a SOT23-3L package (SO). All are lead (Pb) free, with 100% matte tin lead frame plating.

## 11. Function Description

The SC245X device is a magnetic sensor with a digital output that indicates when the magnetic flux density threshold has been crossed. Programming can be performed at the end of the line to optimize the sensor on a per unit or per module basis. The user can select the magnetic operating points across a range spanning -22mT to 22mT, the magnitude hysteresis across a range spanning 0.5mT to 10mT, and whether the device responds to north or south magnetic fields (unipolar switch) or both (omnipolar switch), and output polarity (direct or inverted). Additionally, the Hall switch can be programmed to enter a micropower mode as required.

The output of SC245X switches low (turns on) when a magnetic field (South or North polarity) perpendicular to the Hall element exceeds the operate point threshold,  $B_{OP}$ . After turn-on, the output is capable of sinking 40mA and the output voltage is  $V_Q (sat)$ . When the magnetic field is reduced below the release point,  $B_{RP}$ , the device output goes high (turns off). The difference in the magnetic operate and release points is the hysteresis,  $B_{HYS}$ , of the device. This built-in hysteresis allows clean switching of the output even in the presence of external mechanical vibration and electrical noise.

### 11.1. Magnetic Field Direction Definition

A positive magnetic field is defined as the magnetic South pole facing the marked side of the package.

Fig.4 Magnetic Field Direction Definition

### 11.2. Transfer Function

“Omnipolar” magnetic characteristics, it means the device reacts to both North and South magnetic pole. The purpose is to detect the presence of any magnetic field applied on the device.

Fig.5 Omnipolar Transfer Function diagram

Fig.6 Omnipolar and Unipolar Inverted output Transfer Function diagram

“Unipolar” magnetic characteristics, it means the device only reacts to North or South magnetic pole.

Fig.7 Unipolar Transfer Function diagram

## 12. Typical Application

Fig.8 SC245X Typical Application Circuit

The SC245X contains an on-chip voltage regulator can reduce ripple and noise in the power output. In applications that operate the device from an unregulated power supply, transient protection must be added externally. For applications using a regulated line, EMI/RFI protection may still be required. It is recommended that  $C_1$  capacitor be connected to the ground in parallel near the  $V_{DD}$  power end of the chip, with a typical value of 0.1  $\mu\text{F}$ .  $R_1$  recommends a 100  $\Omega$  current limiting resistor, packaged in SMD larger than 0805 form.  $R_L$  selects appropriate pull-up resistors based on actual application requirements.  $C_L$  is an optional output capacitor for increase system EMC ability.

#### TO-92S Package Outline Dimensions

**Notes:**

- (1) All unit in mm.
- (2) Dimension does not include mold flash, protrusions or gate burrs.
- (3) Allowable dambar protrusion shall be in excess at maximum material condition.

If no tolerance is specified, the dimension shall be theoretical reference value and shall not represent the exact dimension for actual measurement.
