

Unipolar Magnetic Field Response Linear Hall Sensor

1. Features

- Analog output linear Hall sensor
- Unipolar magnetic field response, wide output range
- Fast power-on start < 1us
- Single current source output
- Low noise output, no output filtering required
- Operating temperature range from -40°C to 105°C
- SOT23-3L PKG

2. Applications

- Keyboard applications
- Linear triggers
- Open/close detection
- Gaming buttons

3. Description

The SC4015 is a linear Hall effect sensor chip whose output voltage is proportional to the supply voltage and the magnetic field strength it senses.

The zero-field output voltage (no magnetic field) of the SC4015 is typically 66% of the supply voltage, with a typical sensitivity of 3.9mV/Gs at a 5.0V supply voltage and 2.0mV/Gs at a 3.3V supply voltage.

The chip typically operates at 3.3V or 5.0V, with a maximum voltage of 25V. It supports an operating temperature range of -40°C to 105°C, making it suitable for commercial, consumer, and industrial applications.

This product comes in a 3-pin SOT-23-3L package; the package material is lead-free with 100% matte tin frame plating.

11. Function Description

Magnetic Field Direction Definition: SOT23-3L(SO) package, the magnetic field S pole is defined as a negative magnetic field on the marking.

Quiescent Output Voltage (V_{OUTQ}): Quiescent Output Voltage indicates the output voltage of the IC when there is no magnetic field.

Sensitivity(S)

$$Sens = [VOUT(B1) - VOUT(B2)] / (B1 - B2)$$

When the South Pole magnetic field perpendicular to the chip tagged side approaches, the output voltage increases proportionally, until it reaches supply voltage. Conversely, when the North Pole magnetic field perpendicular to the chip tagged side approaches, the output voltage decreases proportionally, until it reaches ground level. Sensitivity is defined as the specific value of the output voltage variation and the magnetic field variation, commonly in mV/Gs or mV/mT.

12. Typical Application

Fig.4 Typical Application Circuit

When the power supply voltage is 5V, the static (zero field strength) output voltage of the chip V_Q is usually around 3.15V, and when the power supply voltage is 3.3V, V_Q is usually around 2.1V. For the SO package, when the N-pole magnetic field perpendicular to the screen surface of the chip increases, the output voltage of the chip increases proportionally. In contrast, when the S-electrode acts on the screen surface of the chip, the output voltage drops synchronously in the same proportion. The maximum output voltage of the chip at room temperature is V_{CC}-0.7V, and the minimum output voltage is 0.8V, where the linear range is 0.8V-4.2V.
